Q1: Which of the following best describes your primary role? 50 ⓘ

Q2: How many years of professional (work) experience do you have in the financial industry? 50 ⓘ

Q3: How often do you utilise Large Language Models (LLMs) for quantitative or analytical financial tasks in your research or professional activities (specifically: time-series forecasting, risk assessment, portfolio construction, or information extraction etc)? 50 ⓘ

Q4: Before this survey, how familiar were you with the following biases tha... 50

Q5: How often do you see these biases discussed in the financial LLM papers or reports you read? 50 ⓘ

Q6: In your opinion, how critical is the impact of each specific bias on th... 50

Q7: How confident are you that benchmark models capture real-world financial scenarios, including considerations of latency, costs, and the availability of realistic financial dataset? 50 ⓘ

Q8: To what extent does current LLM-in-finance research provide clear guidance for identifying or measuring above biases? 50 ⓘ

Q9: Are there ready-to-use tools or frameworks to evaluate these biases? 50 ⓘ

Q10: Do you run specific technical checks to catch these biases?(Look-ahead Bias: Using future info in past predictions; Survivorship Bias: Excluding failed entities from data; Narrative Bias: Generating plausible but ungrounded stories; Objective Bias: Prioritizing confident answers over uncertainty; Cost Bias: Ignoring latency, fees, and operational costs) 50 ⓘ

Q11: What is the biggest bottleneck to effective bias mitigation? 50 ⓘ

Q12 (Optional): What is the most important missing evaluation guideline, tool, or practice that would help you address financial biases in LLM-based financial systems?

Response 1

Nothing beats long term backtesting (5+ years). No paper tests llm strategies for that long. However there isn't a common dataset available for that. There isn't any such diverse, multimodal, timestamped dataset. Scraping it is hard enough. That's why most people and paper focus on real time performance and short term results.

Response 2

A systematic, domain-specific bias audit framework that quantifies bias impact on decisions.

Response 3

Explanatory analysis

Response 4

A key missing practice is systematic counterfactual and temporal evaluation, where LLM based financial systems are tested on strictly time separated data with explicit stress tests for look ahead, survivorship, and narrative biases. This should include mandatory uncertainty reporting (confidence ranges and abstention options), benchmarking against simple baseline strategies, and post/hoc audits that compare model recommendations to outcomes under alternative market scenarios. Such evaluations would reveal whether models are exploiting spurious patterns, overconfident storytelling, or future information rather than productive robust, decision/relevant insights.

Response 5

Guidelines to simulate realistic experimental settings for empirical evaluation and real-world scenarios

Response 6

Robustness Tests on unseen data and model explainability
